

EDUGRADE AI ASSESSMENT PORTAL

STUDENT ASSIGNED ANSWER SHEET

Student Response:

Cloud computing means getting computing services like data storage, servers, and software on-demand over the internet. Instead of hosting everything on a local hard drive or physical server, you rent resources from cloud companies on a pay-as-you-go basis.

There are three main types of cloud deployments:

- Public Cloud: This is owned by external providers like Amazon or Google. Resources are shared with other customers and accessible over the public internet.
- Private Cloud: This cloud is dedicated solely to a single company. It can be hosted locally at the company's own office, or managed externally, keeping data highly secure on a private network.
- Hybrid Cloud: This is a hybrid mix of public and private clouds. It connects the two configurations so that applications and data can move freely between them when needed.

The three biggest cloud providers today are Amazon Web Services (AWS), Microsoft Azure, and Google Cloud (GCP).
